

# Data Analytics

## CS301

### *The Great Review*

Week 14: 30 November  
Fall 2021

Oliver BONHAM-CARTER

# Course Summary

## CMPSC-301 Data Analytics (4 Credits)

An introduction to computational methods of data analysis with an emphasis on understanding and reflecting on the social, cultural, and political issues surrounding data and its interrogation. Participating in hands-on activities that often require teamwork, students study, design, and implement analytics software and learn how to extract knowledge from, for instance, financial, political, and scientific sources of data. Students also investigate the biases, discriminatory views, and stereotypes that may be present during the collection and analysis of data, reflecting on the ethical implications of using the resulting computational techniques. During a weekly laboratory session, students use state-of-the-art statistical software to complete projects, reporting on their findings through both written documents and oral presentations. Students are invited to use their own departmentally approved laptop in this course; a limited number of laptops are available for use during class and lab sessions. Prerequisite: FS\*102 or permission of the instructor. Distribution Requirements: QR, PD.

---

**Requisites:**

FS\*102 or permission of the instructor - Must be completed prior to taking this course.

**Locations:**

Main Campus

# Course Objectives

## Course Objectives

Students successfully completing this class will have developed:

1. A “big-picture” view of data analytics.
2. An understanding of the objectives and limitations of data analytics.
3. An understanding of the main data analytics methods.
4. Practical skills using relevant software tools and programming techniques.
5. An understanding of the contemporary roles of power and difference as they relate to the knowledge derived from a data set.

# How Did We Achieve These Objectives?

- Class lessons with activities using R to explore data sets
- Labs where students were given opportunity to apply classroom learning to data sets to uncover own researches
- Guest speakers who came to discuss how their own research involves DA
  - Ron Mattocks
  - Lydia Eckstein, PhD
  - Yee Mon Thu, PhD
  - Steven Onyeiwu, PhD
  - Chelsea Peebles, Jesse Sealand (Erie Insurance)

# Jobs and Careers

National

## Big Data Analytics Job Trends

Big Data Analytics x

+ Add Term

Find Trends

Scale: Absolute | Relative

- Many more job posting where analytics is absolutely required

# Money to Be Made

**Big Data Analytics Job Titles & Salaries**

- High-paying salaries DA
- These careers have security due to the ever-presence of data in research, industry and everywhere else.

<https://www.edureka.co/blog/10-reasons-why-big-data-analytics-is-the-best-career-move>

# More Important Each Day

## Big Data Analytics - Priority in Organizations

Peer Research – Big Data Analytics Survey

- Organizations are looking for people to help them process, understand what is in their data to make decisions.

# Helping Business Development

- Using Some Form of Analytics that is Helping the Business
- Believes that Analytics can Predict Many Aspects of Business
- Increased Operational effectiveness
- Competitive Edge in Understanding Customer Trends & Patterns

- Organizations realize that data drives their business.
- When will your career in DA begin?!

# Forbes

- ***“75% of firms are prioritizing big data and analytics expertise in their hiring decisions, stating that having these skills is critical for any candidate to be considered an IoT (Internet of Things) expert.”***

- In this class, you learned how to use machines to harness the power of data.

# Meaningful Information

- How do we harness this power of data analytics?

# Topics Covered

- **Google Analytics**
  - Web traffic Information: terms and plots
- **Visualizations: types and meanings**
- **R Statistics**
  - Basic syntax and methods
- **Library features**
  - Tidyverse, nycflights13, lubridate
- **Concepts**
  - Exploratory data analysis
  - Tidy data manipulation
  - Managing date and time
  - Others from recent lessons

# We Have Ethical Backbone

- We discussed ethical concepts.
- For example: *Twelve Million Phones, One Dataset, Zero Privacy*, A New York Times opinion piece
- Link:  
<https://www.nytimes.com/interactive/2019/12/19/opinion/location-tracking-cell-phone.html>

Opinion | **THE PRIVACY PROJECT**

## Twelve Million Phones, One Dataset, Zero Privacy

By Stuart A. Thompson and Charlie Warzel

DEC. 19, 2019

**THINK**

# We Learned Analysis: Google Analytics

- An introduction to computational and analytical methods for finding patterns in large data sets.
- Google Analytics and web page data analysis
  - Page views?
  - How many users clicked on purchase buttons?
  - How many user downloaded (read, viewed) your hand-out newsletter?
  - How long to land on “check-out” page? Time to decide to buy?

Google Analytics

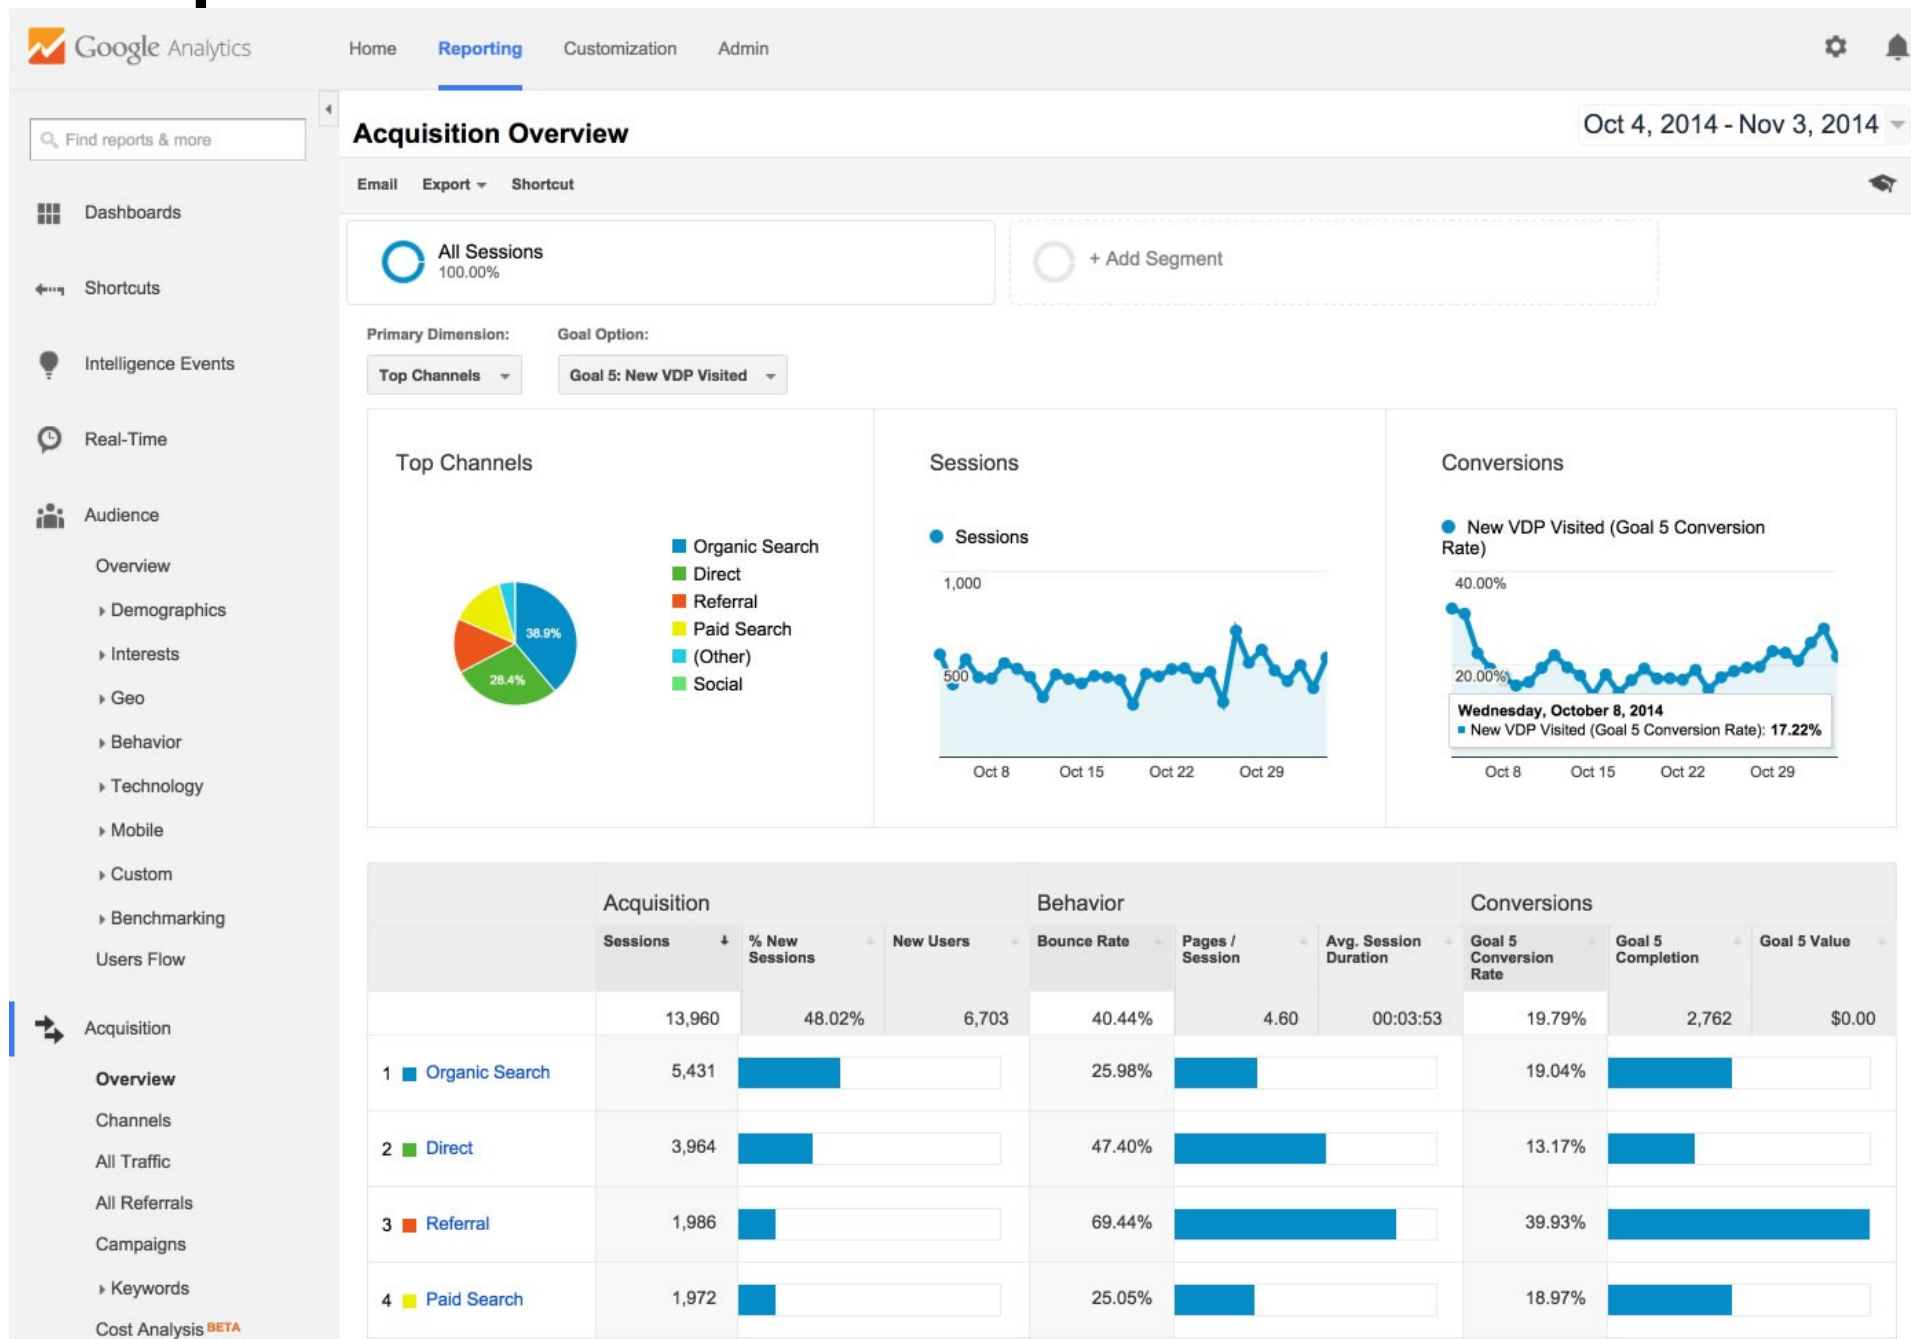

# Audience

- Who are your users?
- When was that?

# Acquisition

- How do these users get to your site?

# Where To Now?

- Google Analytics is a tool allowing for convenient analysis of web sites
- The code was written by developers for this purpose.
- What if you need tools and there are no current developers to create them?

**Develop  
Your  
Own  
Tools!!**

# Questions to Ask?

- No rules about which questions to ask to guide your research.
- Two types of general questions for making discoveries
  - What type of variation occurs within my variables?
  - What type of covariation occurs between my variables?

# Terms To Know

- A **variable** is a quantity, quality, or property that you can measure.
- A **value** is the state of a variable when you measure it. The value of a variable may change from measurement to measurement.
- An **observation** is a set of measurements made under similar conditions (you usually make all of the measurements in an observation at the same time and on the same object). An observation will contain several values, each associated with a different variable. I'll sometimes refer to an observation as a data point.
- **Tabular data** is a set of values, each associated with a variable and an observation. Tabular data is tidy if each value is placed in its own "cell", each variable in its own column, and each observation in its own row.

# The R Programming Language

- <https://www.r-project.org/>
- What is the R language?
  - An open source, well-developed programming platform for work in statistics, mathematics and data analytics
  - Built-in libraries to simplify programming
  - Language includes conditionals, loops, user-defined recursive functions and input and output facilities.
- Community Blogs:
  - <https://www.r-bloggers.com/>
  - <https://twitter.com/rstudiotips>

# Simple Steps: R Programming

- Strings
  - “Hello World”
- Concatenation of strings
  - `H <- “Hello”`
  - `W <- “world”`
  - `paste(H,W, sep = “ ”)`
    - What is the result here??

- You try: print your full name!
  - `name <- first-name,`
  - `Lastname <- last-name`

# Code for a Simple GGPlot

- `library(tidyverse)` or if not present,
- `install.packages("tidyverse")`
- `ggplot(data = mpg) + geom_point(mapping = aes(x = displ, y = hwy))`
- Establish the *canvas* (where the plot is shown)
- `Ggplot()`
- Link to the data (set is called, 'mpg')
  - `ggplot(data = mpg)`
- Compute the geometry of point placement on canvas
  - `geom_point(mapping = ... )`
- Compute the aesthetics of the plot (titles, color, point type, etc)
  - `aes(x = displ, y = hwy)`

# dplyr Basics

- Five key dplyr functions
  - Pick observations by their values (**filter()**).
  - Reorder the rows (**arrange()**).
  - Pick variables by their names (**select()**).
  - Create new variables with functions of existing variables (**mutate()**).
  - Collapse many values down to a single summary (**summarise()**).
- Find help for each: ?keyword

# Potential Pitfalls in Theory

We will return to visual comparisons

- We get an slight idea of cancellations
- But many more non-cancelled flights than cancelled flights

# Histogram as Text

- The `cut_width()` gives a textual representation of the histogram.

```
> diamonds %>%  
+   count(cut_width(carat, 0.5))  
# A tibble: 11 x 2  
  `cut_width(carat, 0.5)`      n  
    <fctr> <int>  
1    [-0.25,0.25]    785  
2    (0.25,0.75]   29498  
3    (0.75,1.25]  15977  
4    (1.25,1.75]   5313  
5    (1.75,2.25]   2002  
6    (2.25,2.75]    322  
7    (2.75,3.25]     32  
8    (3.25,3.75]      5  
9    (3.75,4.25]      4  
10   (4.25,4.75]      1  
11   (4.75,5.25]      1
```

# This Plot May Make It Hard To See The Phenomenon

- The counts variable seems to have values from all over the range.
- This is noise in our plot
- If one group is much smaller than the others, then it is hard to see the differences in its distribution.

# Different Bin Widths

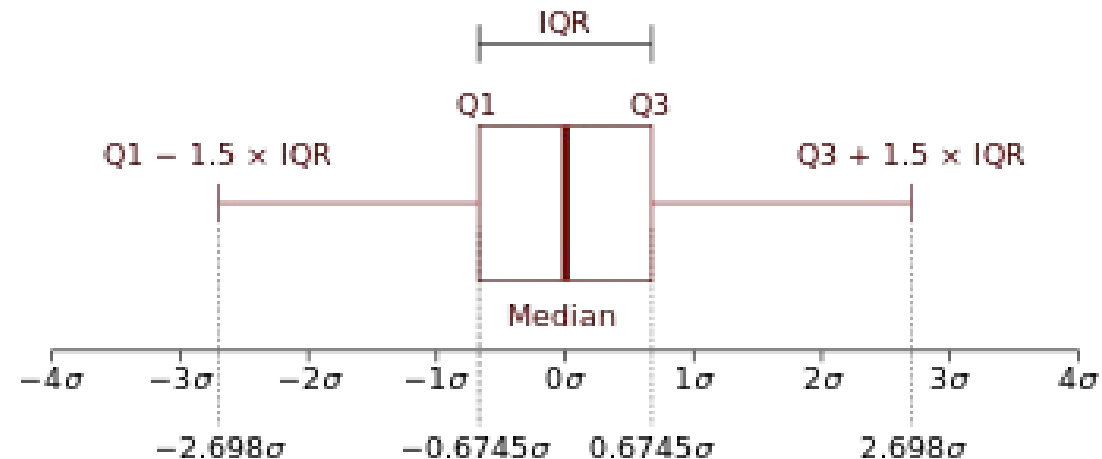

- Set the width of the intervals in a histogram with the binwidth argument, which is measured in the units of the x variable.
- Left histogram: bins are too small, too much individual data and hides underlying pattern (frequency distribution).
- Right histogram: bins are too large, hard to spot trends in the data.

# Box Plots

- For the normal distribution, the values less than one standard deviation away from the mean account for 68.27% of the set; while two standard deviations from the mean account for 95.45%; and three standard deviations account for 99.73%.

# Visualization - Mini Distributions: Cut vs Color

```
diamonds %>%  
  count(color, cut) %>%  
  ggplot(mapping = aes(x = color, y = cut)) +  
    geom_tile(mapping = aes(fill = n))
```

# Visualization - Mini Distributions: Carat vs Price

```
ggplot(data = diamonds) +  
  geom_point(mapping = aes(x = carat, y = price))
```

# Visualization - Mini Distributions: Carat vs Price

```
ggplot(data = smaller) +  
  geom_bin2d(mapping = aes(x = carat, y = price))
```

# Dates and Times in R

- How do we deal when time or dates are a part of our analysis?
- How do we determine if our data spreads across a leap year?
- What if we measures our observations using a minute-by-minute time frame for some series of years? If there is a leap year, is there a problem?

# Vaccine Lab 3: What Does **Our Data** Say About (All) Vaccines of Data?

```
library(tidyverse)
```

```
library(dslabs)
```

```
library(dplyr)
```

```
ggplot(data = us_contagious_diseases) + geom_point(mapping = aes(x = year, y = count, color = year)) + geom_vline(xintercept = 1965, color = "red")
```

Cases  
of  
Illness

# Basic Stats

## Standard Deviation

- A quantity calculated to indicate the extent of deviation for a group as a whole.

# Linear Regression

**Map a line from the points  
and study the line.**

# Let's Talk Linear Models

# Linear Regression

- Is one thing able to influence another thing?
- A linear approach for modeling the relationship between a scalar **dependent variable  $y$**  and one or more explanatory variables, or **independent variables**, denoted by  **$x$** .
- *Simple linear regression*: Single explanatory variable; **models  $x$  and  $y$**
- *Multiple linear regression*: More than one explanatory variable ( **$y$ 's**); **models  $x$  and  $y_1, y_2$**

# Let's Hit the Code

- Linear model syntax

lm

Model formula:  
response ~ predictor(s)

data

```
mod <- lm(tc2009 ~ low, data = crime)
```

# Linear Regression: Code

```
ctl <- c(4.17, 5.58, 5.18, 6.11, 4.50, 4.61, 5.17, 4.53, 5.33, 5.14)
trt <- c(4.81, 4.17, 4.41, 3.59, 5.87, 3.83, 6.03, 4.89, 4.32, 4.69)
group <- gl(2, 10, 20, labels = c("Ctl", "Trt"))
weight <- c(ctl, trt)
lm.D9 <- lm(weight ~ group)
lm.D90 <- lm(weight ~ group - 1) # omitting intercept
summary(lm.D9)
```

- **H0: there is no relationship between vars,  $m = 0$**
- **Ha: There is a relationship between vars,  $m \neq 0$**

**# Check the p-value:**

- **If p-val  $\leq \alpha = 0.05$ : reject H0.**
- **If p-val  $> \alpha = 0.05$ : do not reject H0.**

# So, Are My Models Made From Sampling Full Data Set Any Good?

- Use *Parametric statistics* to check your model before you use it!

```
> summary(mod)
```

```
Call:
```

```
lm(formula = earn ~ height, data = pWages)
```

```
Residuals:
```

```
      Min       1Q   Median       3Q      Max  
-49392 -17589  -4448  10236 108209
```

```
Coefficients:
```

```
              Estimate Std. Error t value Pr(>|t|)  
(Intercept) -138901.1    50897.3   -2.729 0.007530 **  
height       2607.4      760.6     3.428 0.000891 ***
```

```
---
```

```
Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```
Residual standard error: 29100 on 98 degrees of freedom
```

```
Multiple R-squared:  0.1071,    Adjusted R-squared:  0.09795
```

```
F-statistic: 11.75 on 1 and 98 Df,    p-value: 0.0008909
```

```
mod = lm(earn ~ height, data = pWages)
```

# Basic Stats: T-Tests

- Suppose: We are the producers of two kinds o drinks: green and purple. Each drink comes in a bottle and we would like to know whether the green and the purple drink are filled to the same levels.
- We randomly select 9 bottles from our entire set of 100000 bottles

# Basic Stats: T-Tests

- By inspection,
  - **Purple bottles seem a little under-filled**
  - **Green bottles seem a little over-filled**
- Can we use a statistical test to conclude whether the whole batch is under- or over-filled?

# T-Test: Hypotheses

- We want to know: **Is there a statistically significant difference between the two groups in terms of the average extent to which the bottles are filled?**
  - **Null hypothesis ( $H_0$ ):** The bottles are filled the same
  - **Alternative hypothesis ( $H_a$ ):** There is a difference between the filling of bottles.
- Remember: we have a sample of only nine bottles from the super set of 100000 bottles. Statistics is used to extrapolate from the small set to the larger set.

# Use $p$ -Values

- The  $p$ -Value says that we are sure that our sample size that we randomly selected is a very good representation of our larger super set.
- 95 confidence interval range: Our selected bottles fit within 95 per cent of the entire set → a good representation of the whole set of 100000 bottles.
- **Reject the Null Hypothesis when  $p < 0.05$**   
(when  $p$  is close to zero.)

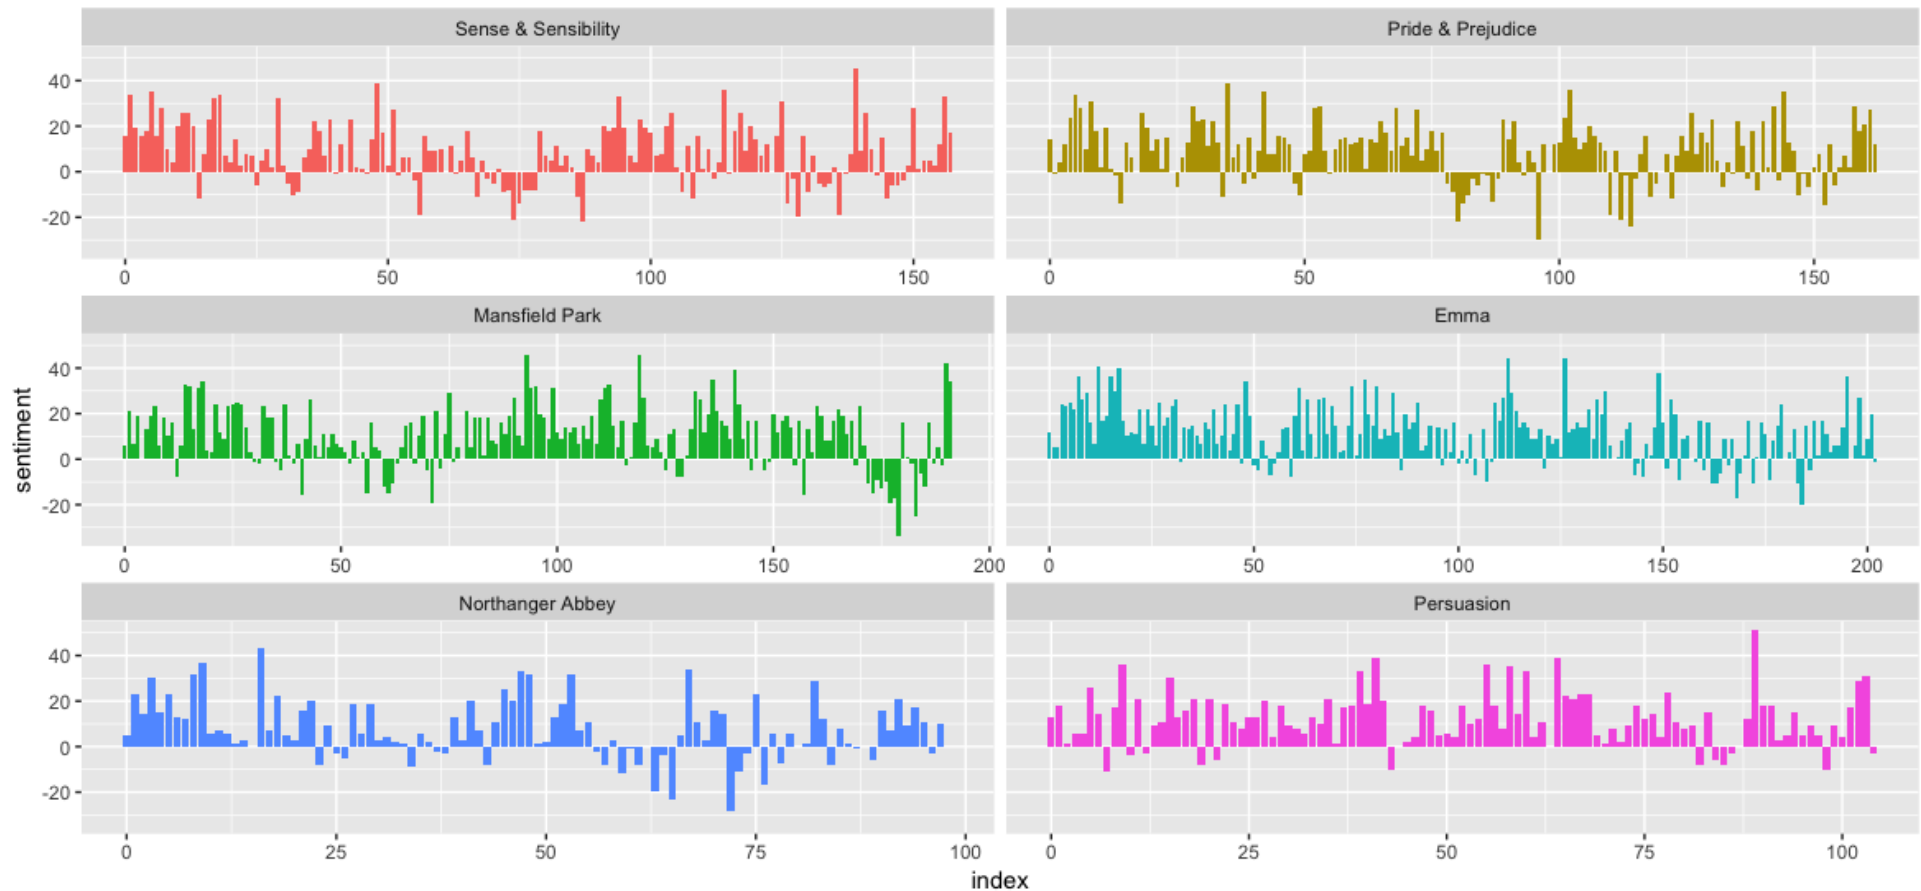

# Basic Stats: T-Tests

```
data_drinks <- data_drinks %>%  
  select(Colour, percentFull)  
#Run the t-test: a comparison of means.  
t.test(data = data_drinks, percentFull ~ Colour)  
# Check the p-value:  
– If p-val  $\leq$  alpha = 0.05: reject H0.  
– If p-val  $>$  alpha = 0.05: do not reject H0.
```

- **What do we conclude about our *data\_drinks*?**
